

Question 10 wants us to "Create a function for a linked list that sorts the list so that first all odd numbers are listed"

I incorporated Question 10 into Question 4 since I already made a linked list there. So whatever linked list is being created in Question 4, Question 10 will just order the list so that the odd #'s are listed first, followed by the rest. I make the function "LinkedList OddEvenSort (LinkedList list)"

This takes in the values of the linked list already made, and using a while loop it tests if it's an even # if it isn't we just move it to the front of the list, and then just input the values and reorganizes them in the list
